## Problem 1

Data points:

| x | y |
| ---: | ---: |
| 0.6 | 5.16 |
| 1.4 | 7.33 |
| 2.5 | 9.24 |
| 3.7 | 11.05 |
| 4.8 | 13.34 |
| 5.6 | 15.66 |

questions:

1. Calculate the residual mean square. (0.1688)
2. Construct a $90 \%$ confidence interval for the slope.
3. Test whether the intercept is 0 . (At $\alpha=5 \%$ level.)
4. Test whether the intercept is 4 . (At $\alpha=5 \%$ level.) $(t 0=0.504, p=0.641$ )
5. In what interval can you find the point of the true regression line at $x=3$ with $99 \%$ probability? $(9.33,10.87)$
6. In what interval can you find a new measurement at $\mathrm{x}=2$ with $90 \%$ probability? (7.15, 9.09)

|  | Param. | Std.Err | t | p | $-95,00 \%$ <br> Cnf.Lmt | +95,00\% <br> Cnf.Lmt |
| :--- | ---: | ---: | :---: | :---: | ---: | ---: |
| Intercept | 4,170 | 0,337 | 12,38 | 0,00025 | 3,23 | 5,11 |
| x | 1,976 | 0,094 | 20,97 | 0,00003 | 1,71 | 2,24 |

## Problem 2

Data points:

| x | y |
| ---: | ---: |
| 1.3 | 13.7 |
| 2.6 | 10.5 |
| 3.3 | 9.9 |
| 4.9 | 7.4 |
| 5.5 | 5.1 |

questions:

1. Calculate the residual mean square. (0.3582)
2. Construct a $99 \%$ confidence interval for the intercept. $(12.02,19.88)$
3. Can we say that the slope is -2 ? (At $\alpha=5 \%$ level.)
$(\mathrm{H} 0:$ beta $=-2, \mathrm{t} 0=0.67, \mathrm{p}=0.551)$
4. In what interval can you find the point of the true regression line at $\mathrm{x}=5$ with $95 \%$ probability? (5.337, 7.716)
5. In what interval can you find a new measurement at $x=2$ ? (At $\alpha=5 \%$ level.) $(9.94,14.43)$

| Effect | Param. | Std.Err | t | p | $\begin{aligned} & -95,00 \% \\ & \text { Cnf.Lmt } \end{aligned}$ | $\begin{gathered} +95,00 \% \\ \text { Cnf.Lmt } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Intercept | 15,95 | 0,67 | 23,71 | 0,0002 | 13,81 | 18,09 |
| x2 | -1,88 | 0,18 | -10,74 | 0,0017 | -2,44 | -1,33 |

## Problem 3

8 jams were made with different cooking parameters. The quality of the jams was measured on a 0 to 100 point scale. The table below contains the cooking parameters and the quality of the result.

| temperature |  | $120^{\circ} \mathrm{C}$ |  | $180^{\circ} \mathrm{C}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| cooking time |  | 1 hrs | 2 hrs | 1 hrs | 2 hrs |
| sugar | 20 g | 35 | 28 | 45 | 42 |
|  | 50 g | 44 | 39 | 48 | 44 |

Questions

1. Calculate all the effects.
2. Draw a main effect plot for cooking time. What can you deduct?
3. Draw an interaction plot for sugar/cooking time. What can you deduct?
4. Draw an interaction plot for cooking time/temperature. What can you deduct?
5. Draw a Pareto chart. Then based on it reduce the model.
6. Using the reduced model, make an estimate for the measurement at 2 hrs cooking time, 25 g sugar and $160^{\circ} \mathrm{C}$ temperature.

## Solution

| sugar | temp | time | $y$ |
| :---: | :---: | :---: | :---: |
| 20 | 120 | 1 | 35 |
| 20 | 120 | 2 | 28 |
| 20 | 180 | 1 | 45 |
| 20 | 180 | 2 | 42 |
| 50 | 120 | 1 | 44 |
| 50 | 120 | 2 | 39 |
| 50 | 180 | 1 | 48 |
| 50 | 180 | 2 | 44 |

1. Calculate all the effects.

| Factor | Effect |
| :---: | :---: |
| (1)sugar | 6,25000 |
| (2)temp | 8,25000 |
| (3)time | $-4,75000$ |

2. Draw a main effect plot for cooking time. What can you deduct?

With longer cooking time the jam becomes less good. If the cooking time is increased from 1 hour to 2 hours the quality drops with 4.75 points.
3. Draw an interaction plot for sugar/cooking time. What can you deduct?

There is no interaction between the the amount of sugar and the cooking time. No matter how long is the cooking time ( 1 or 2 hours) adding more sugar ( 50 instead of 20) would improve the quality of the jam with the same amount.
4. Draw an interaction plot for cooking time/temperature. What can you deduct?

There is no interaction between the the temperature and the cooking time.
5. Draw a Pareto chart. Then based on it reduce the model.

The reduced model:
$\hat{Y}=40.625+3.125 x_{1}+4.125 x_{2}-2.375 x_{3}-1.875 x_{1} x_{2}$
6. Using the reduced model, make an estimate for the measurement at 2 hrs cooking time, 25 g sugar and $160^{\circ} \mathrm{C}$ temperature.
$\hat{Y}=40.625+3.125 * 0+4.125 * 0-2.375 * 1-1.875 * 0 * 1=38.25$

## Problem 4

The table below contains the design and the results of a set of expetiments. (The conversion is the outcome.)

| pressure <br> $($ bar $)$ | temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | pH | conversion <br> $(\%)$ |
| :---: | :---: | :---: | :---: |
| 0.5 | 20 | 5 | 2.76 |
| 1 | 20 | 5 | 26.79 |
| 0.5 | 30 | 5 | 38.90 |
| 1 | 30 | 5 | 31.37 |
| 0.5 | 20 | 7 | 3.08 |
| 1 | 20 | 7 | 26.39 |
| 0.5 | 30 | 7 | 39.10 |
| 1 | 30 | 7 | 30.38 |

Questions:

1. Calculate all the effects and coefficients.
2. Draw a main effect plot for the pressure. What can you deduct?
3. Draw an interaction plot for the temperature/pressure. What can you deduct?
4. Draw a Pareto chart. Then based on it reduce the model.
5. Using the reduced model, make an estimate for the conversion at $0.6 \mathrm{bar}, 2{ }^{\circ} \mathrm{C}$ and 5.5 pH .

## Solution

1. Calculate all the effects and coefficients.

| Factor | Effect | Coefficient |
| :---: | :---: | :---: |
| Intercept |  | 24,85 |
| (1)Pressure | 7,8 | 3,89 |
| $(2)$ temp | 20,2 | 10,09 |
| $(3) \mathrm{pH}$ | $-0,2$ | $-0,11$ |
| 1 by 2 |  | $-7,95$ |
| 1 by 3 |  | $-0,24$ |
| 2 by 3 |  | $-0,09$ |
| $1 * 2 * 3$ |  | $-0,06$ |

2. Draw a main effect plot for the pressure. What can you deduct?

The conversion is higher at higher pressure. If the pressure is increased from 0.5 bar to 1 bar the conversion increases with 3.89\%.
3. Draw an interaction plot for the temperature/pressure. What can you deduct?

There is interaction between the temperature and the pressure.
4. Draw a Pareto chart. Then based on it reduce the model.

The reduced model:
$\hat{Y}=24.8+3.9 x_{1}+10.1 x_{2}-7.9 x_{1} x_{2}$
5. Using the reduced model, make an estimate for the conversion at 0.6 bar, $29^{\circ} \mathrm{C}$ and 5.5 pH . $\hat{Y}=24.8+3.9 * \frac{0.6-0.75}{0.25}+10.1 * \frac{29-25}{5}-7.9 * \frac{0.6-0.75}{0.25} * \frac{29-25}{5}=34,3$
